Liberty Mobile for Access Control & Safety

Liberty Mobile - No More Cards, No More Readers or No More Control Panels

Liberty Mobile is the newest Liberty App for lowering the cost of securing facilities. Users simply use their Windows Phone to scan and transmit a QR Code door identifier or NFC Chip. If the user is authorized, the door unlocks through a Liberty Bridge. The application will operate using a WiFi connection or by use of the Cellular System should WiFi not be detected.

The cost of Card Readers, Cards and Control Panels is eliminated while delivering a superior security solution over existing IT infrastructure. Apps will soon be available for all major Smart Phone operating systems.

Where Operational Policy is strict such as in industrial plants, greater savings can be realized by the elimination of Electric locks and associated Power Supplies. By using door contacts, an alarm is generated if a person happens to pass through a door without using their Smart Phone for access. The installation cost savings through this approach is enormous. There is no need for door wiring, electric locks, card readers, control panels, cards or even local servers.

Enhanced Safety for Industrial Applications

Industrial and some commercial owners are faced with the requirement of Emergency Mustering. Liberty Mobile QR codes or NFC Chips can be located at key locations to provide low cost automation of the mustering function—no more lengthy roll calls; just a quick mobile report on who is missing and automatic mobile notification to emergency personnel. Liberty Mobile can also be used to dramatically reduce the cost of deploying Guard Tour systems.

Secure Printer Networks

Liberty Mobile solves the problem of Document Security on a shared printer network. A QR code attached to each printer requires staff to be physically present for document printing.

Contractor Tracking

QR codes or NFC Chips can be affixed to doors to track deliveries and contractors; such as snow removal contractors.

Key Points

- A QR Code or NFC Chip at a door along with a Smart Phone will provide enhanced Access Control
- Card Readers and Cards are not required.
- A Smart Phone will transmit a door identifier QR code to a Server via Wi-Fi or Cellular which ever is available.
- Emergency Mustering can be accomplished by placing QR Codes external to the facility.
- MS codes also supported
